Interio — English overview

English overview of the project. The full Russian README is ../../README.md; this page covers what the project is, how to run it, and where the details live.

What it is

A small web application for an interior design studio: visitors take a quiz about their flat, the studio receives a request, and an administrator moderates the flow in a panel. FastAPI, server-side templates, static JavaScript, SQLite — one process, no external services required.

Run it

```
cp .env.example .env      # set ADMIN_CODE to a long random value
make install
make test                 # 15 tests, no network access
make run                  # http://localhost:8000/
# or, on any platform:
./forge.sh start          # linux/macos
forge.bat start           # windows
```

What is inside

Part	Where	What you can borrow
Configuration from the environment	`app/config.py`	one `settings()` call, no import-time state
SQLite layer without an ORM	`app/db.py`	idempotent schema, cursor with commit
Passwords, sessions, roles	`app/security.py`	cookie sessions, fail-closed admin code
E-mail with attachments	`app/mailer.py`	optional feature that degrades quietly
HTTP layer	`app/routers/`	one router per responsibility
Control scripts	`forge.sh`, `forge.bat`	start/stop/doctor/logs/env in one command

Module borrowing map: modules/module-map.md.

Documentation

- index.md — map of all documents
- BUILD.md, verification/matrix.md, security/secrets.md
