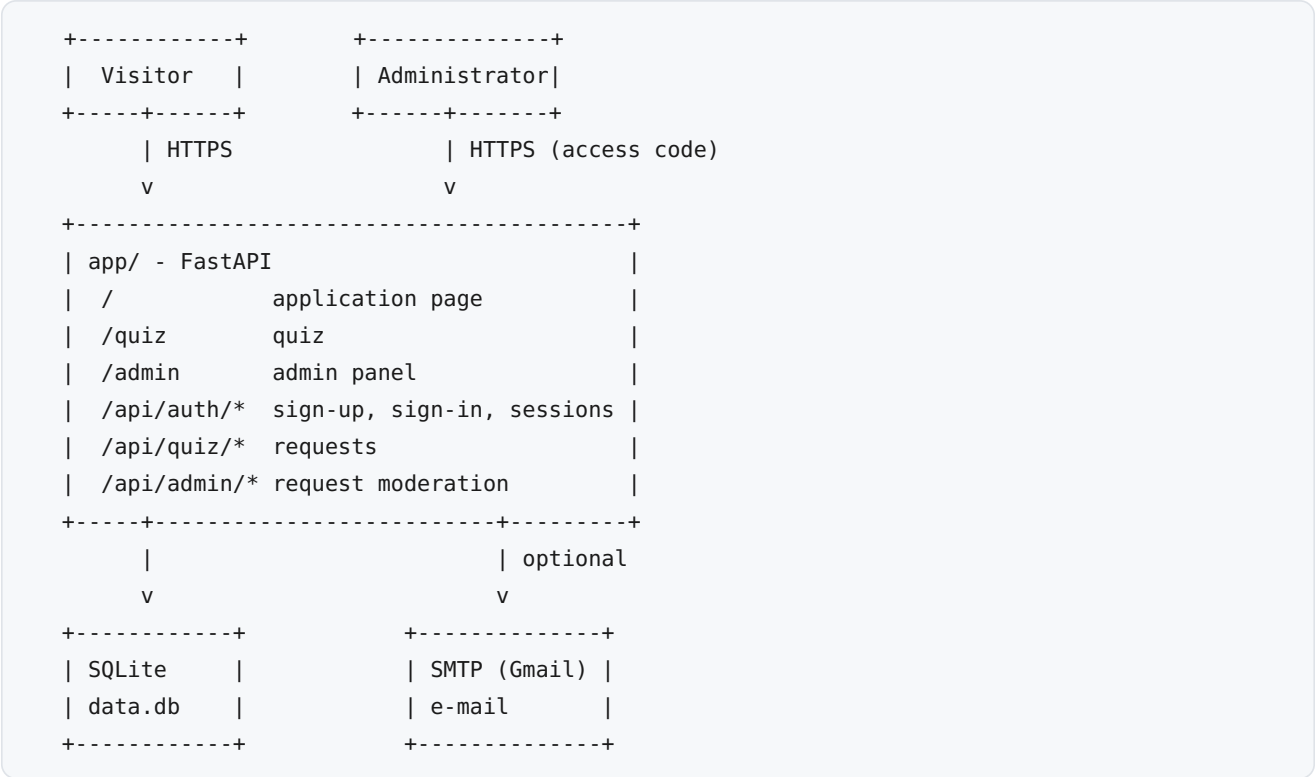
System context

English version of ../../architecture/system-context.md.

What this is

Interio is a small web application for interior design selection: sign-up and sign-in, an interactive quiz, and an admin panel for requests. One FastAPI process, server-side templates, static files, SQLite.

Context diagram



Modules of the `app/` package

The code is organised by responsibility; every module can be taken to another project on its own (borrowing map: ../modules/module-map.md).

Module	Responsibility	Depends on
`app/config.py`	environment reading, `settings()`, server address	nothing
`app/db.py`	SQLite schema, connection, cursor with commit	`config`
`app/security.py`	passwords, sessions, cookies, role checks, admin code	`db`, `config`
`app/mailer.py`	SMTP, attachments, "mail disabled" without configuration	`config`
`app/models.py`	Pydantic request and response models	nothing
`app/routers/auth.py`	sign-up, sign-in, sign-out, current user	`db`, `security`, `models`
`app/routers/quiz.py`	request validation and storage, background e-mail	`db`, `mailer`, `models`
`app/routers/admin.py`	request list and status change (admin role only)	`db`, `security`, `models`
`app/routers/pages.py`	HTML pages and quiz state stubs	`models`
`app/keepalive.py`	self-ping (optional)	`config`
`server.py`	`create_app()` + `uvicorn.run`, import compatibility	everything

Rule: the HTTP layer never talks to the database on its own — only through `app.db`, and password/session rules live in exactly one place (`app.security`).

Supported scope

Declared: Python 3.11+, Linux/Render, a browser. Not declared: several replicas (SQLite is a single file, sessions live in the same database), other DBMS, running without a filesystem.
