Code style and lint

English version of ../../development/code-style.md.

What is checked

Tool	Version	Configuration	Where it runs
ruff	`ruff==0.8.4` (`requirements-dev.txt`)	`ruff.toml`	`make lint`, CI job "Tests and lint"
pytest	`python -m pytest -q`	`tests/conftest.py`	`make test`, CI

The configuration lives in the repository, not in an editor: `ruff.toml` sets `line-length`, `target-version = "py311"` and the rule set `E4,E7,E9,F` (errors and potential bugs). The ruff version is pinned, so `make lint` gives the same result locally and in CI.

Why the rule set is narrow

The code is split into `app/` modules now, but historical heritage remains: broad `except Exception` in background tasks and files opened without context managers. Enabling `BLE`, `SIM`, `PLW` produces findings that cannot be fixed in one move without risking behaviour. Therefore:

1. Blocking are the rules that catch real errors.
2. `docs/audit/portability-audit-2026-10-29.md` records the style debt.

How to tighten

1. Take one rule (for example `BLE001`).
2. Add it to `select`, put `# noqa: BLE001` with a comment where the broad catch is intentional (keep-alive, sending e-mail).
3. Remove `noqa` where the exception type can be narrowed.
4. Only then extend `select` further.

Local commands

```
make lint    # ruff over app/, server.py, tests/ and tools/
make test    # pytest, no network, no secrets
make check   # lint + test + docs-check
```
